CIE AS-LEVEL CHEMISTRY 9701

SUMMARIZED NOTES ON THE SYLLABUS

PRACTICAL NOTES

1. ERRORS

$$\text{Estimated error} = \text{No. of readings} \times \frac{\text{smallest div.}}{2}$$

$$\% \text{ Uncertainty} = \frac{\text{Estimated Error}}{\text{Reading}}$$

- **Random error:** usually result from the experimenter's inability to take consistent measurements e.g. in the disappearing cross experiment. It is often due to a problem which persists throughout the entire experiment e.g. random fluctuations in room temperature.
- **Systematic error:** usually caused by measuring incorrectly calibrated apparatus or incorrectly used apparatus e.g. thermometers that consistently read 1°C above the actual temperature, or reading volumes consistently from the wrong part of the meniscus.

2. ACCURACY

APPARATUS	SMALLEST DIVISION	MAX ERROR
BURETTE	• 0.05 cm^3	• 0.1 cm^3
PIPETTE (25 cm^3)		• 0.06 cm^3
VOLUMETRIC FLASK (250 cm^3)		• 0.2 cm^3

3. TITRATIONS

- Burette has to be written to 2 DP.
- Two best titres must be within 0.1 cm^3 of each other
- If first two titres are within 0.1 cm^3 then no need for the 3rd titre
- Repeat and find the average titre volume with total spread of not more than 0.20 cm^3 .

Use of a Burette	
Advantage	Disadvantage
<ul style="list-style-type: none"> • Lower % error • More accurately calibrated 	<ul style="list-style-type: none"> • Takes longer to add the reagent

- Clean all apparatus properly with distilled water prior starting the experiments.

- Whilst pipetting, the tip of the pipette should be placed against the wall of the container. In this way, droplets of the solvent will not spill out of the container.
 - Clean the walls with distilled water to ensure you include all moles of solution.
 - Add indicator as per the instructions. Add too much, and you would get incorrect results.
- Clean burette and pipette with solution, but not volumetric and conical flask as it will give inaccurate values.
- Always read the bottom meniscus of the burette and ensure the burette does not have any air bubbles to remove the jet space.
 - Tap it to free air bubbles.
 - Open the tap to fill the jet space.

- Always swirl the conical flask.
 - Use a white tile underneath to observe any colour change.
 - Titration ends when any colour change is permanent.

- In your second titration attempt (after the rough titre), adjust the burette tap so that it dispenses drop-wise when the reading is near the end-point to find the exact titre value.

- Titration table should look like this:

Initial Burette Reading/ cm^3	0.00 (It must never start from 50 cm^3)	0.00	0.00
Final Burette Reading/ cm^3			
Titre/ cm^3			
Best Results	(add tick here)		

4. TEMPERATURE

- Record to nearest 0.5°C when thermometer calibrated in 1°C intervals
- Record to nearest 0.1°C when thermometer calibrated in 0.2°C intervals.
- If one procedure has a greater temperature change, it has higher accuracy due to a lower percentage error.

5. CONVERSIONS

$$1000\text{cm}^3 = 1\text{dm}^3 = 0.001\text{m}^3$$

$$0^\circ\text{C} = 273^\circ\text{K}$$

$$1\text{cm}^3 \text{ of water} = 1\text{g}$$

$$1\text{KJ} = 1000\text{J}$$

6. GRAPHS AND TABLES

- When finding gradient, always use a triangle with hypotenuse greater than half of the line.
- Label axis with quantity and unit.
- Plot graph with a fine cross or encircle dots.
- For each heading in a table, write the quantity measured with the unit separated with a slash.
- Keep significant figures consistent in values in a table.
- Make **only one** table of result for each question.
- Circle anomalous results and exclude them from calculations.
- The line of best fit drawn should ignore anomalous results.
- Ensure your graph covers greater than half the page.
- Points must be within half a small square of the correct position.

7. PRACTICAL SKILLS

7.1 Measuring a Quantity

Temperature	Use a thermocouple
Volume	Use burette If 25cm^3 use pipette
Mass	Use electronic scale

- Repeat and average values

7.2 Thermal Experiments

- Insulate container to stop thermal conduction
- Use a lid to seal container to stop thermal convection
- When heating a hydrated salt, heat to constant mass

7.3 How to Collect CO_2

- Water vapour condenses in the water trough
- Ensure there's no air bubbles in the gas jar when setting up the apparatus.

8. SALT ANALYSIS

- If acid added to a salt produces effervescence, carbonate ion is present, so write "effervescence produced turns limewater milky".
- Label your test tubes.
- Cover the mouth of the test tube with your thumb to sense presence of gas.
- Do not add solutions more than that is required. If the question says to add 1cm^3 of X solution, add roughly around that amount.
- When testing for cations using NaOH and NH_3 , mention the observations when excess of these are added.
- If there are series of colour changes observed, mention all of the colours.

8.1 Test for Gases: techniques

- **NH₃**: Damp a red litmus paper with distilled water and keep it near the mouth of the tube. Do not let it touch the test tube. It should turn blue.
- **SO₂**: Smells like rotten eggs.
 - **There's a number of ways to test this:**
 - You could dip a paper in Potassium dichromate and watch its colour turn from orange to green.
 - If you were to pipe the gas to a solution of Potassium Permanganate, it would turn from pink to colourless.
 - If you dipped damp blue litmus paper, it would turn red.
- **NO₂**: the test tube turns pale brown and disappears if you remove your thumb.

8.2 Test for ions: techniques

- If you are confused between iron (II) and chromium precipitate, keep an eye out for brown precipitate on the surface of the solution. If present, then it is Fe²⁺.
- If you are confused between Ba²⁺ and NH₄¹⁺, heat it. If NH₄¹⁺, ammonia gas will be given out. If you add sulfuric acid to it and it forms white precipitate, then it is barium ion.
- Manganese ions have white precipitate that turns brown in contact with air.
- It's a good idea to revise the solubility table to confirm what the precipitate is.
- If the observations are like the ones mentioned in the Qualitative Analysis Notes at the back of your paper, use that description in the answer.
- **A general salt analysis table:**

Reagent	Observation
NaOH	
Excess	
NH ₄	
Excess	

9. ENTHALPHY CHANGE

- Temperature is measured in 1 decimal places and units given in degree Celsius.
- When measuring masses, a table with values in 2 d. p. must be setup. **For example:**

Mass of the container + mass of the lid/g	
Mass of the container + mass of the lid + the sample/g	
Mass of the container + mass of the lid + residue/g	
Mass of sample used/g	

- All the data must have the same number of decimal places.
- **Use the equation $Q = mc\Delta T$ for heat released:**
 - M is the mass of the total mixture
 - Assuming mass is equivalent to volume where 1g is 1 cm³
 - C is specific heat capacity (assuming it's the same as water i.e. 4.12)
 - ΔT is temperature change
 - No incomplete combustion of fuel occurs
 - Density of the solution is the same as water
 - Units in $J\ mol^{-1}$
- **To calculate enthalpy change:**
 - Use the equation $\Delta H = Q/mol$
 - **Units:** $KJ\ mol^{-1}$, so divide heat released (Q) by 1000.
- **Enthalpy graphs**
 - **To find max temp change via extrapolation:**

- **Exothermic graphs:**

10. RATES OF REACTION

• To calculate rate:

- Appearance of product/change in concentration of product
- Disappearance of reactants/change in mass
- **Unit:** $1/\text{time (s}^{-1}\text{)}$
- Finding gradient of a concentration-time graph
 - The higher the gradient (the steeper the graph), the higher the rate of reaction.
 - The gradient of the graph decreases with time; thus, rate is inversely proportional to time.

• A general rates table for investigation effect of concentration on rates:

Experiment number	Vol of reagent/ cm^3	Vol of distilled water/ cm^3	Reaction time/s	Rate of reaction/ s^{-1}

- Replace the IV columns with other factors that affect rate depending on the question.
- Take a minimum of 3 experimental readings.
- Ensure all other variables are kept constant so that any change in rate is caused by the IV.

• To improve rate of reaction:

- Increase the concentration of a reactant.
- Increase the temperature of the reactants.
- Increase the surface area of a reactant.
- Add a catalyst to the reaction.

11. MODIFICATIONS

• How do repeats improve the reliability of errors?

- Shows consistent results
- Proves/shows values or trend is similar
- Eliminates anomalous results

• How can you make sure a reagent is in excess?

- If solid in excess, then solid remains at the bottom
- If liquid (e.g. acid in excess), then all of the solid dissolves.

Problem	Solution
CO_2 dissolved in a solution	Heat solution to drive off CO_2
CO_2 escapes	Use smaller surface area of substance
Unequal distribution of heat	Stir
Heat loss	<ul style="list-style-type: none"> • Extra/thicker lagging • Use a lid • Use a vacuum flask
Measurement of volume	Use a burette/pipette
Identification of colour change	Use of colorimeter
Temperature fluctuations	<ul style="list-style-type: none"> • Use of a thermostatic water bath • Switch off the air conditioning • Clean dry thermometer/container • Make sure thermometer doesn't touch walls of container • Use a stirrer to ensure even distribution of heat.
Measurement of temperature	<ul style="list-style-type: none"> • Use a thermometer with a smaller scale division • Use an electronic thermometer to avoid parallax error
Uncertainty in graph intersection/ line of best fit	Repeat/extra readings
Water present in hydrated salt crystals	Heat to constant mass
